1 OVERVIEW

Versions of RadSight lower than version 2.60 installed on Terminals will now need to be upgraded using an upgrade script. This document takes you through the steps to do this.

2 STEPS TO UPGRADE RADSIGHT USING THE SCRIPT

- You will need a keyboard and mouse (ideally using a USB hub)
- Log in as the Administrator account
  - Credentials can be found on the card that came with RadSight
  - To get to the user account choice:
    - ctrl+alt+del
    - or press the Windows key 5 times
- Click the Windows key
- Type **cmd** and run it as administrator
- Type **D:** and press return
- Type **CD Win10** and press return
- Type **powershell -ExecutionPolicy Bypass -File ".\Terminal-Upgrade-UWP-to-WPF.ps1"** and press return
- If prompted, click **Yes** (to acknowledge running as administrator
  - The screen may jump back to desktop
    - if so, hold down the Windows key and the Tab key to select the PowerShell screen that asks for the location of the RadSight installer
- When prompted for the location of the RadSight installer, it will default to **D:\Win10** so just hit return
  - The script will take a few minutes to process
  - The screen may go back to the desktop – but it is still upgrading
  - Wait a few minutes
  - The terminal will then reboot
